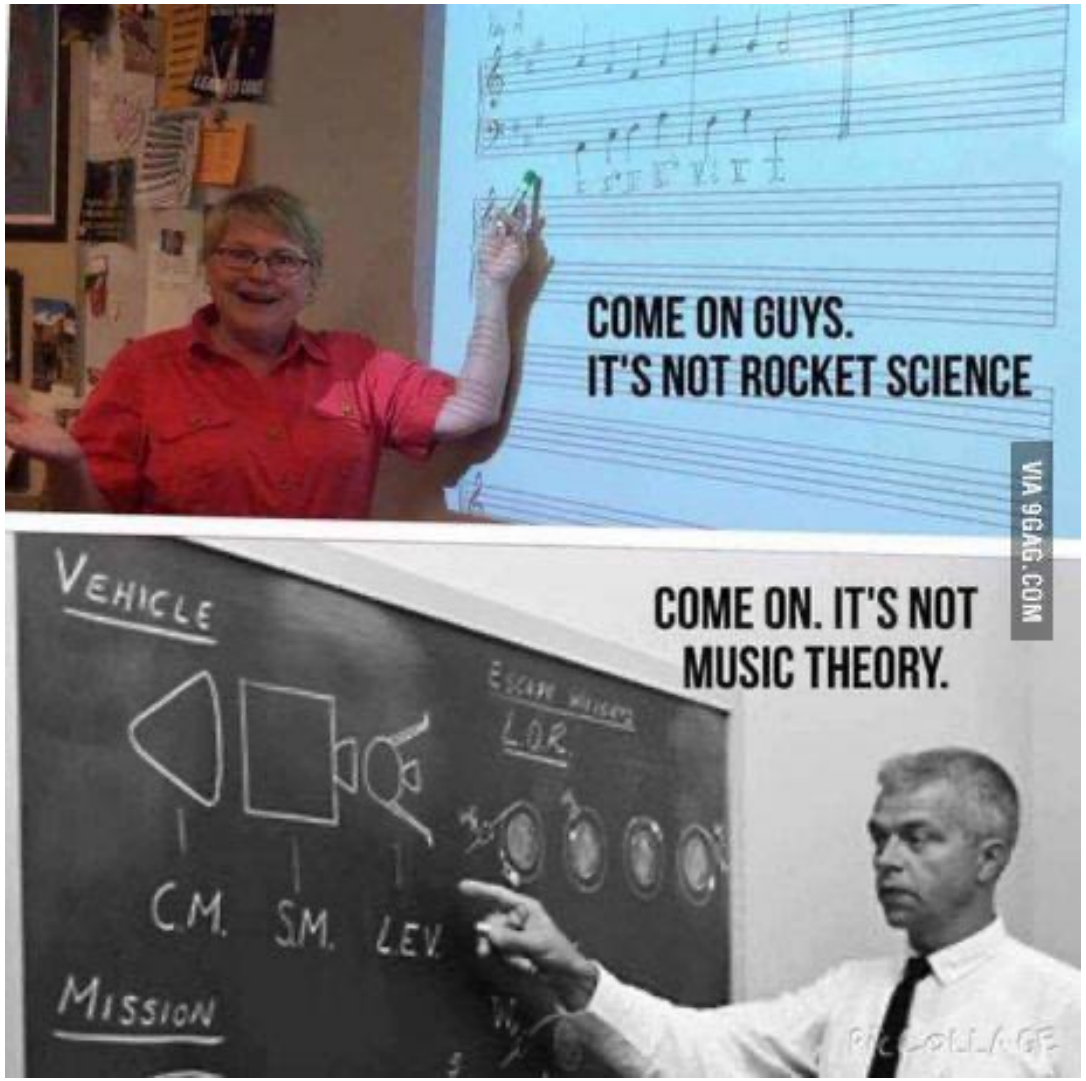
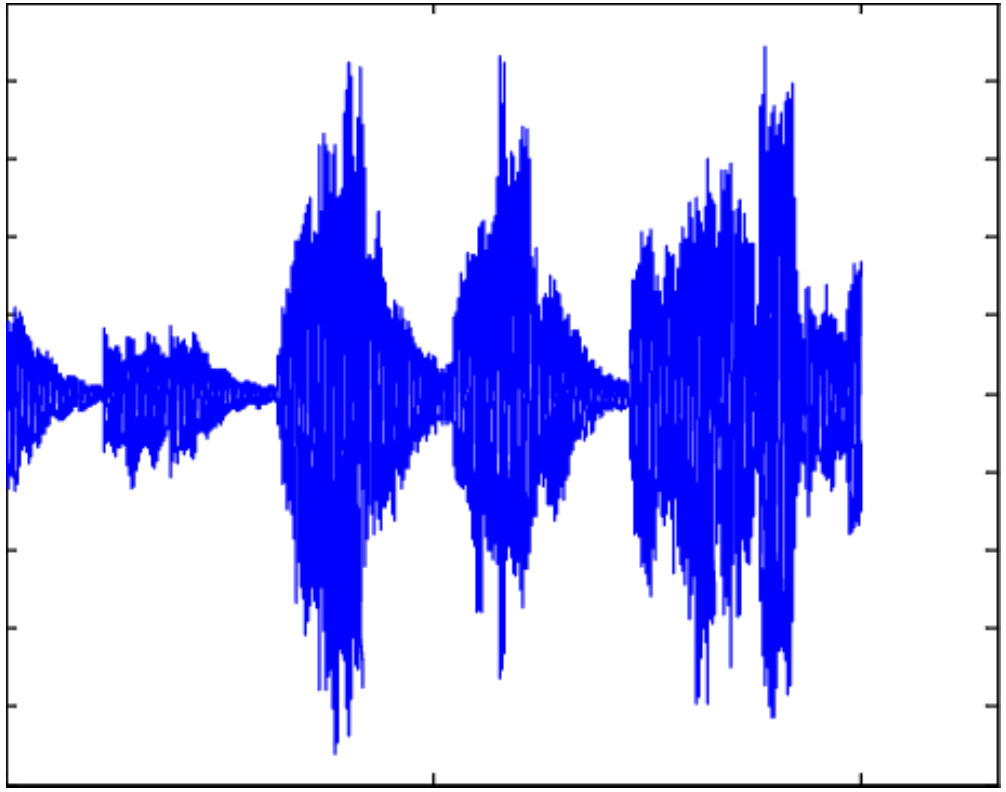
MUSICAL BACKGROUND

Music (theory) Background



Representing Music

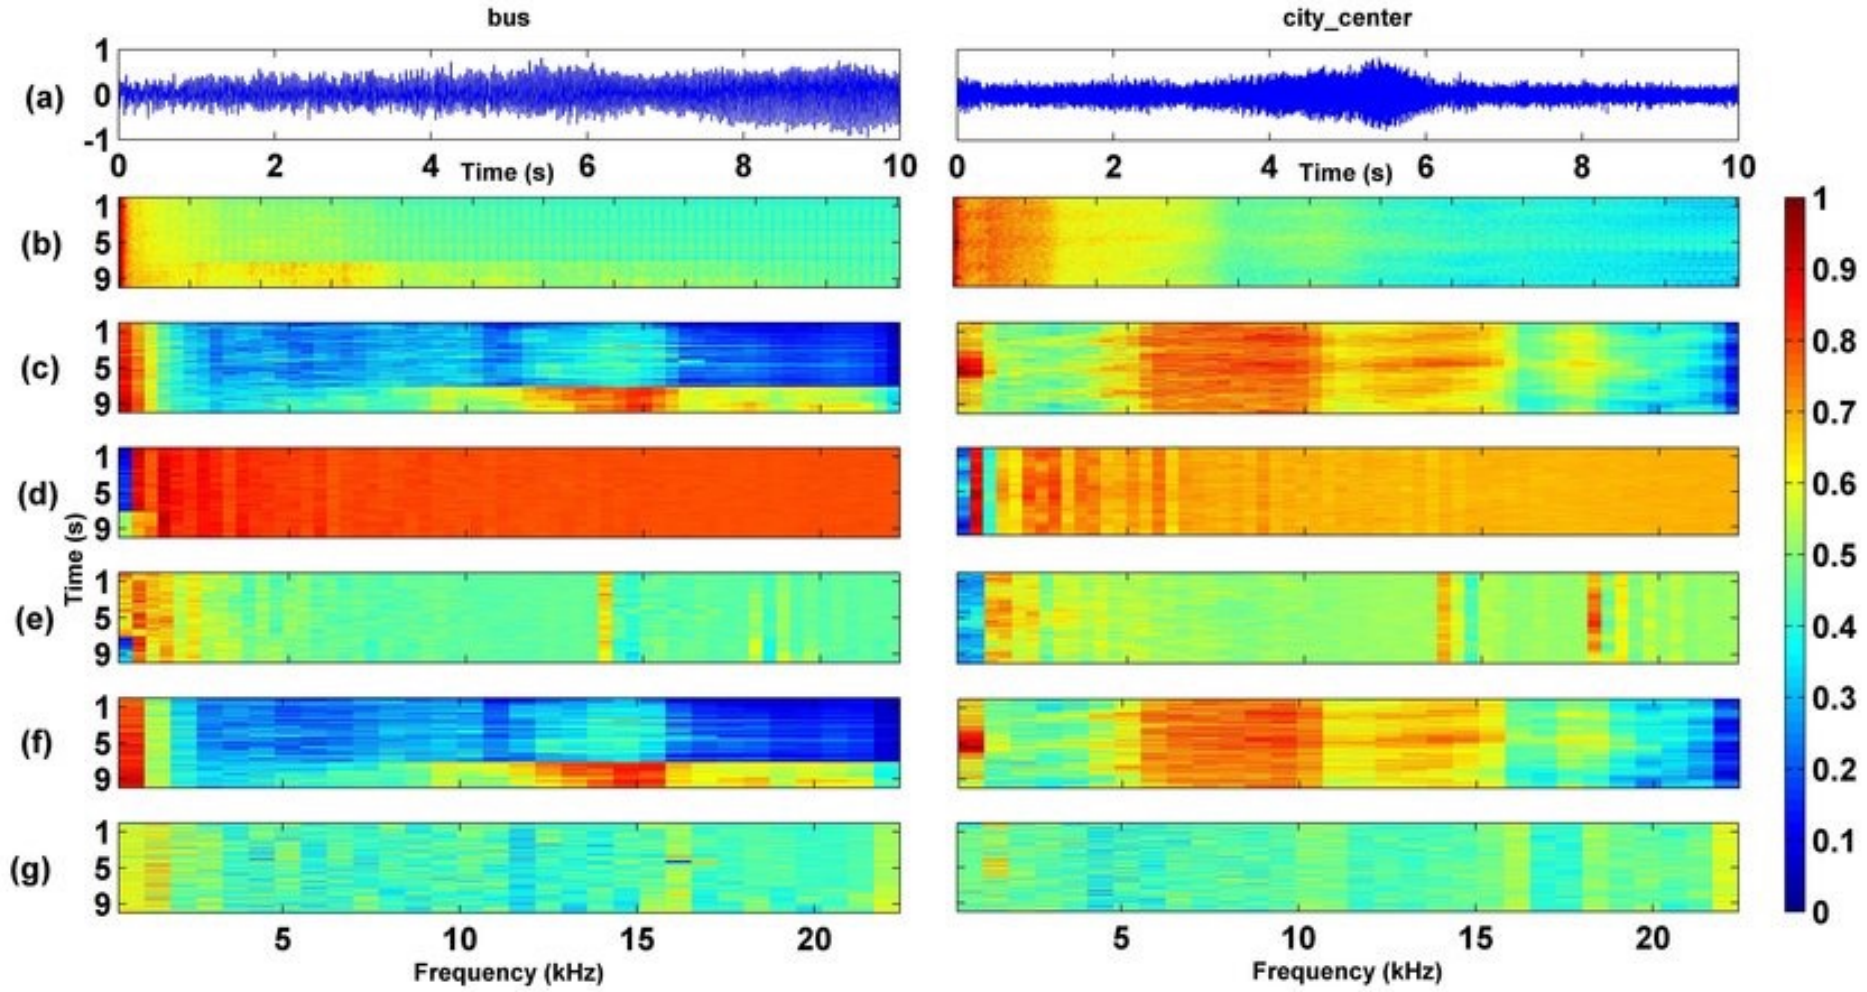


Audio Signal

Symbolic Representation

Audio Signal

- Low structural generality
- High expressive completeness



Symbolic Representations

- High structural generality
- Low expressive completeness (e.g. timbre information usually overlooked)

```
<note>
  <pitch>
    <step>E</step>
    <alter>-1</alter>
    <octave>4</octave>
  </pitch>
  <duration>2</duration>
  <type>half</type>
</note>
```

Figure 1.15 from [Müller, FMP, Springer 2015]

Music Similarity

Music similarity is a defined as the ability to measure the similarity between music tracks

Central task in **Music Information Retrieval**

Central in **many fields**:
- Classification
- Recommendation
- Search

Crucial for **Musicology**

Music Similarity

Music similarity can be approached from two different perspectives:

Context-based Similarity

Non-musical data:

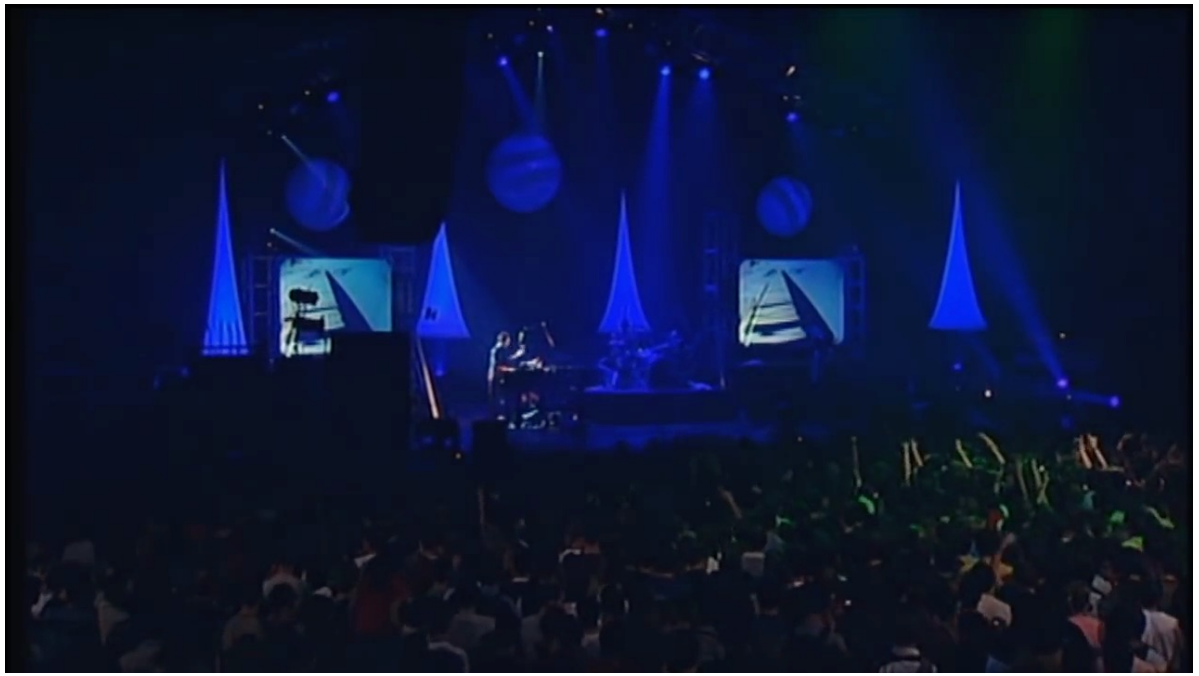
- Metadata
- Song popularity
- Listener's preferences

Content-based Similarity

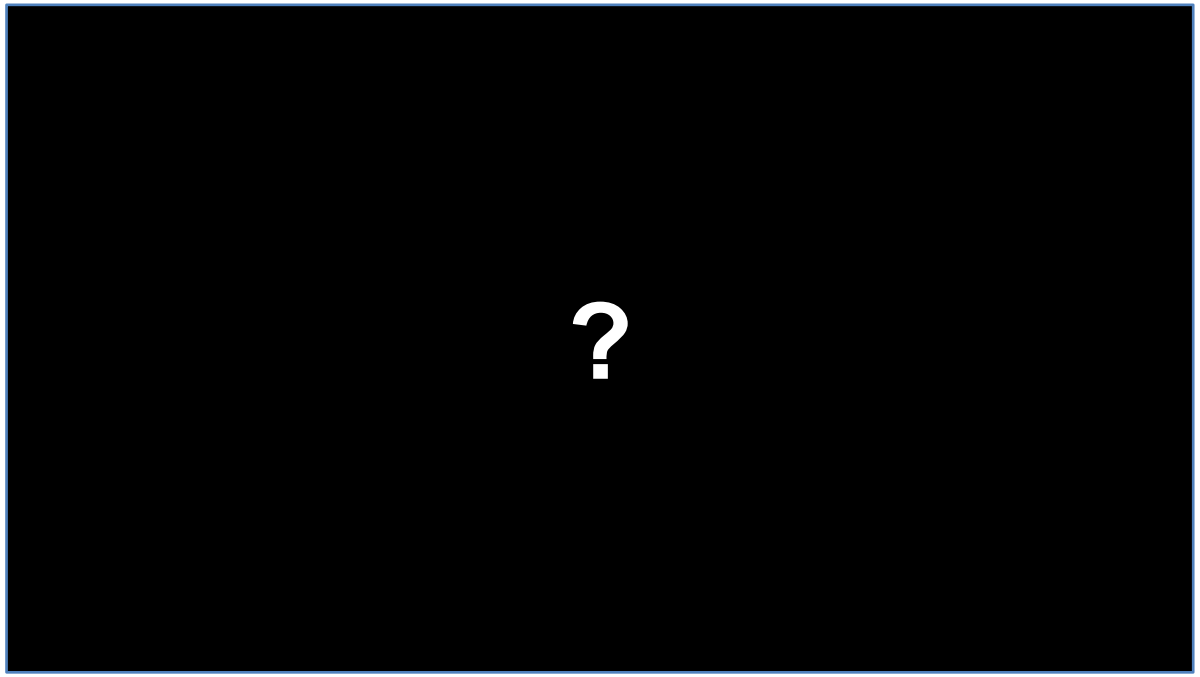
Musical data

Muse - Space Dementia

Can you hear any **similarity** between the two compositions?



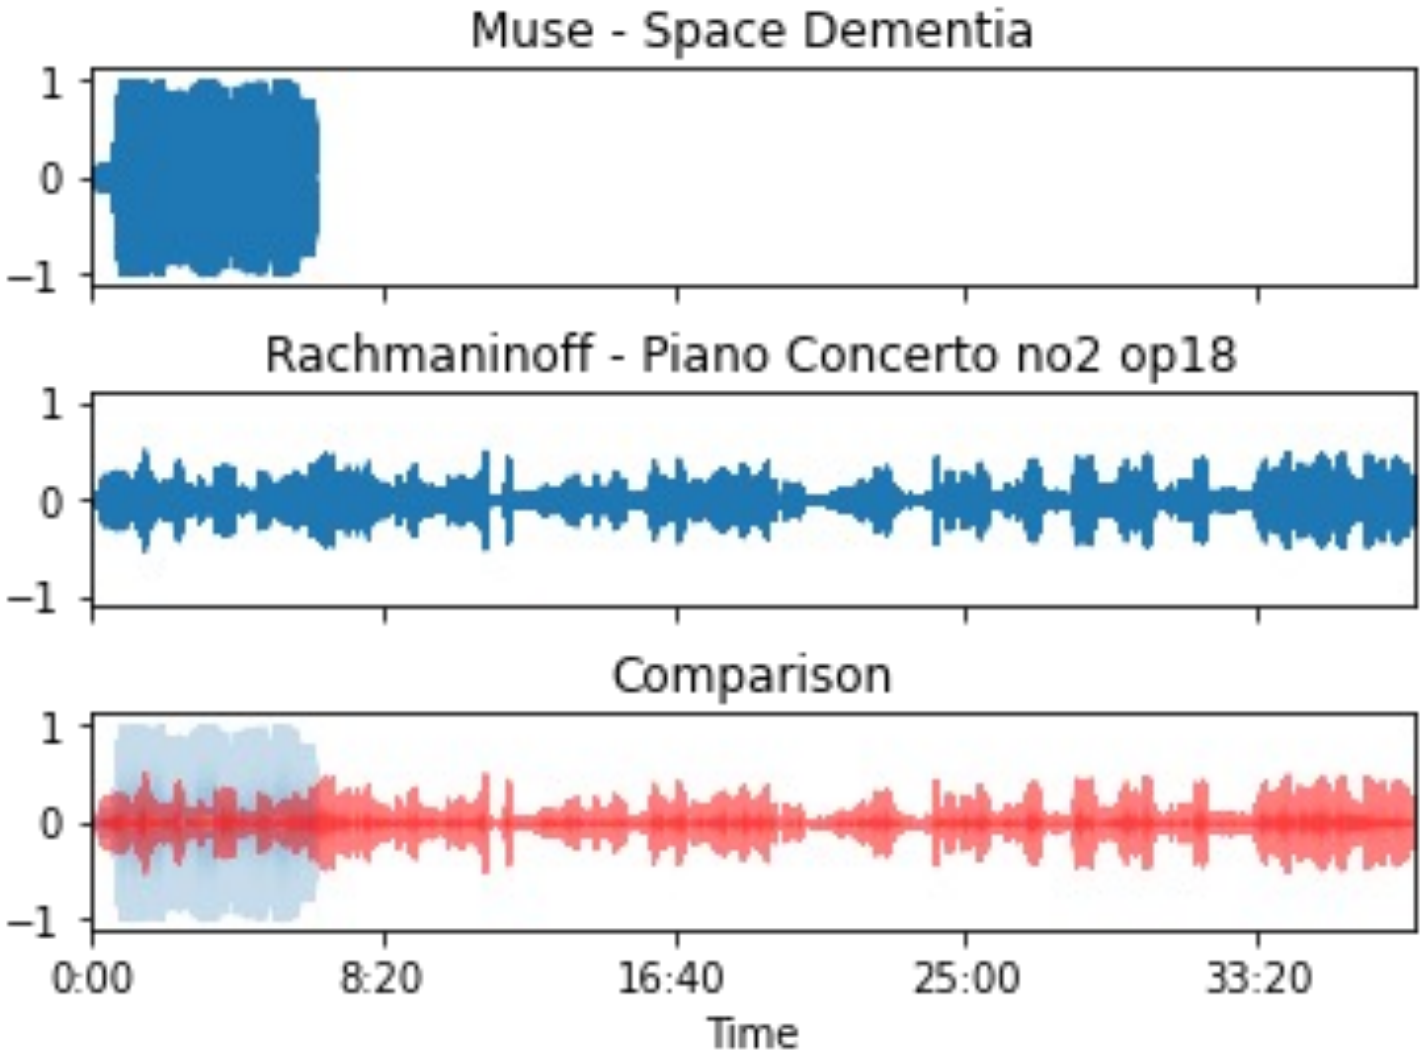
Muse – *Space Dementia* (2001)



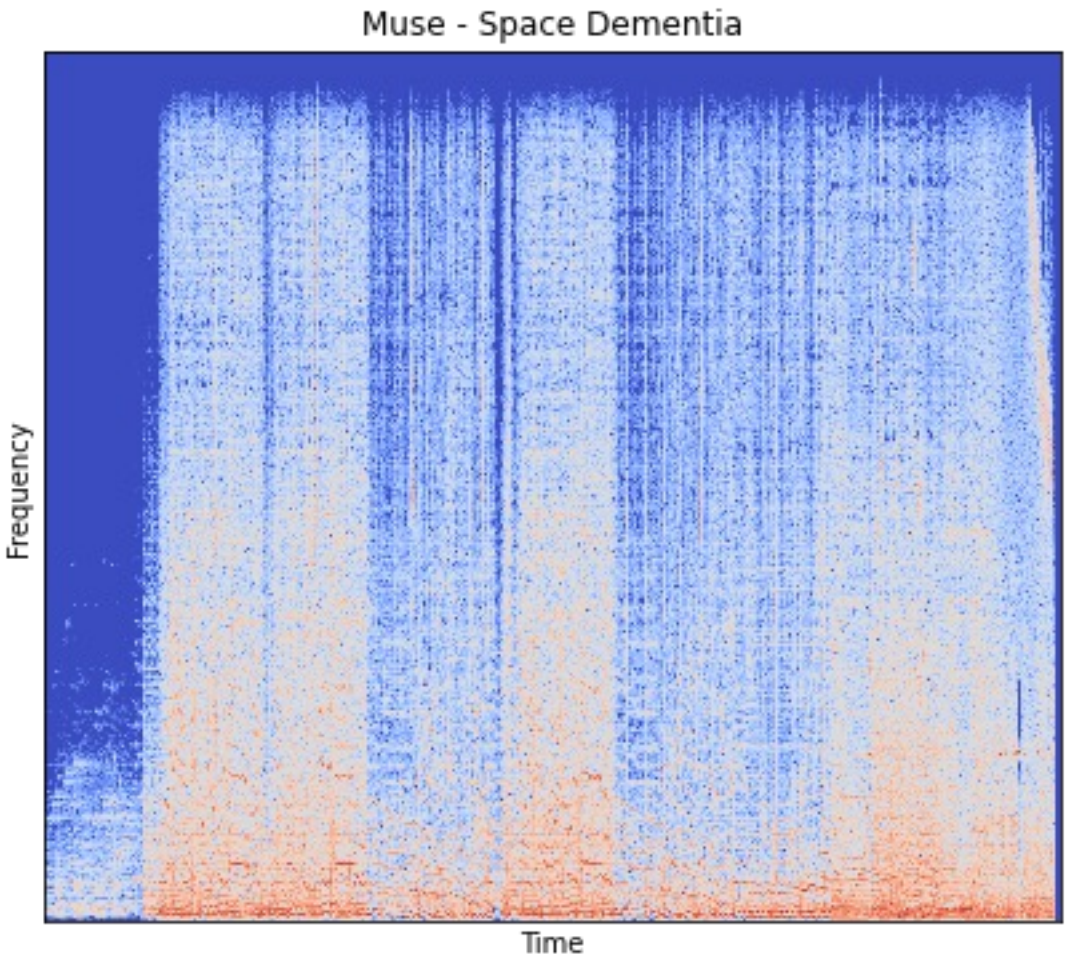
Rachmaninoff – *Piano Concerto no. 2* (1901)

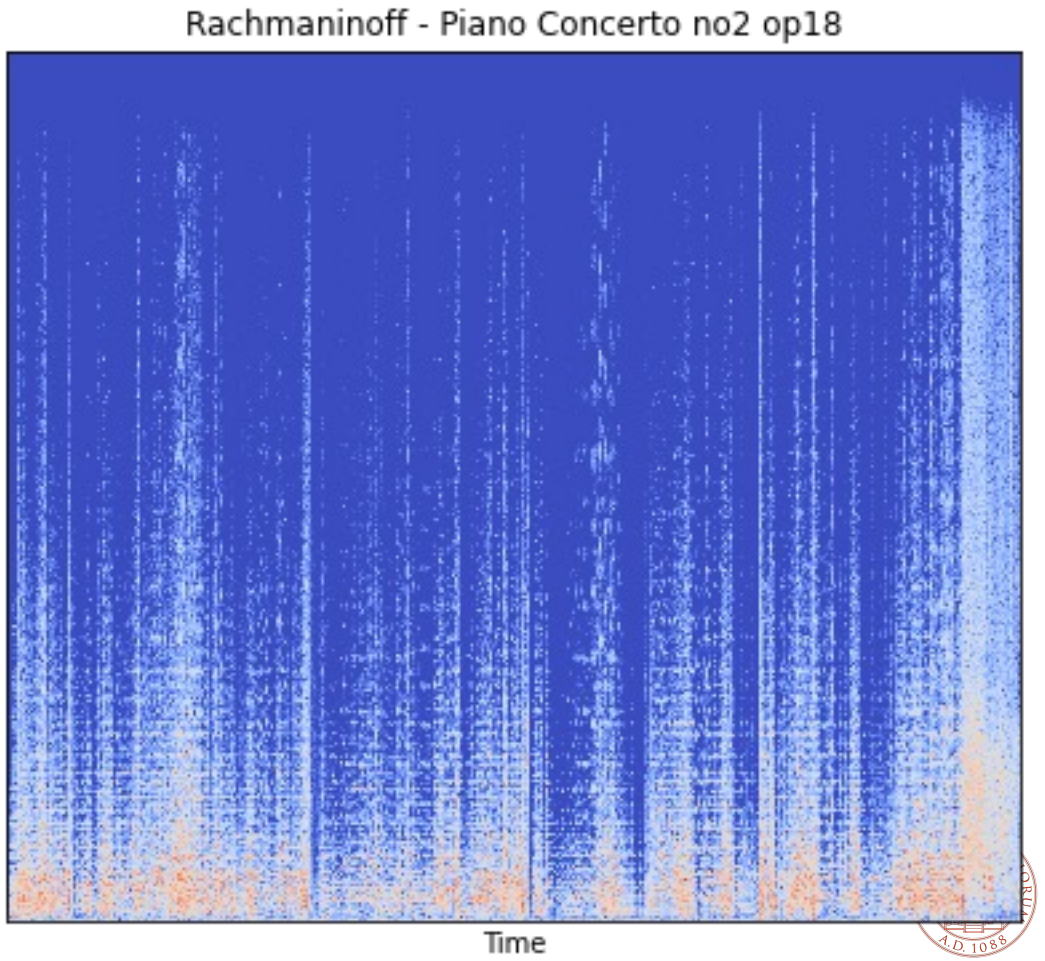
ALMA MATER STUDIORUM
UNIVERSITÀ DI BOLOGNA

Audio signal analysis is not enough

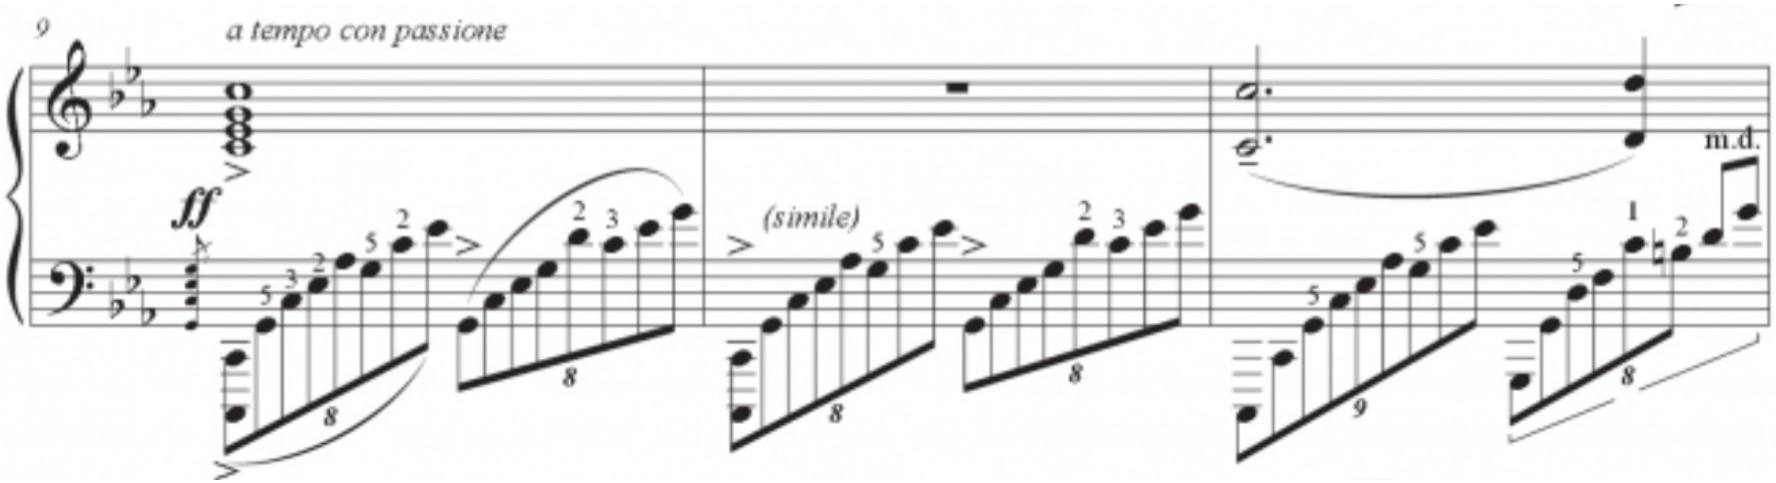


Audio signal analysis is not enough (2)





Symbolic similarity



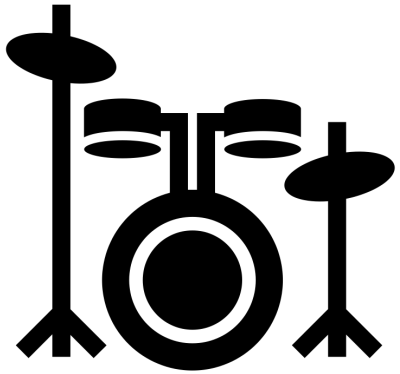
Rachmaninoff – *Piano Concerto no. 2* (1901)

Muse – *Space Dementia* (2001)

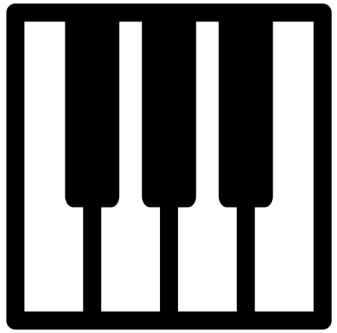
- Same pattern
- Different key
- Different tempo

What is a music composition?

A musical composition is composed by three main elements:



Rhythm



Harmony

Melody

Jean-Benjamin de La Borde

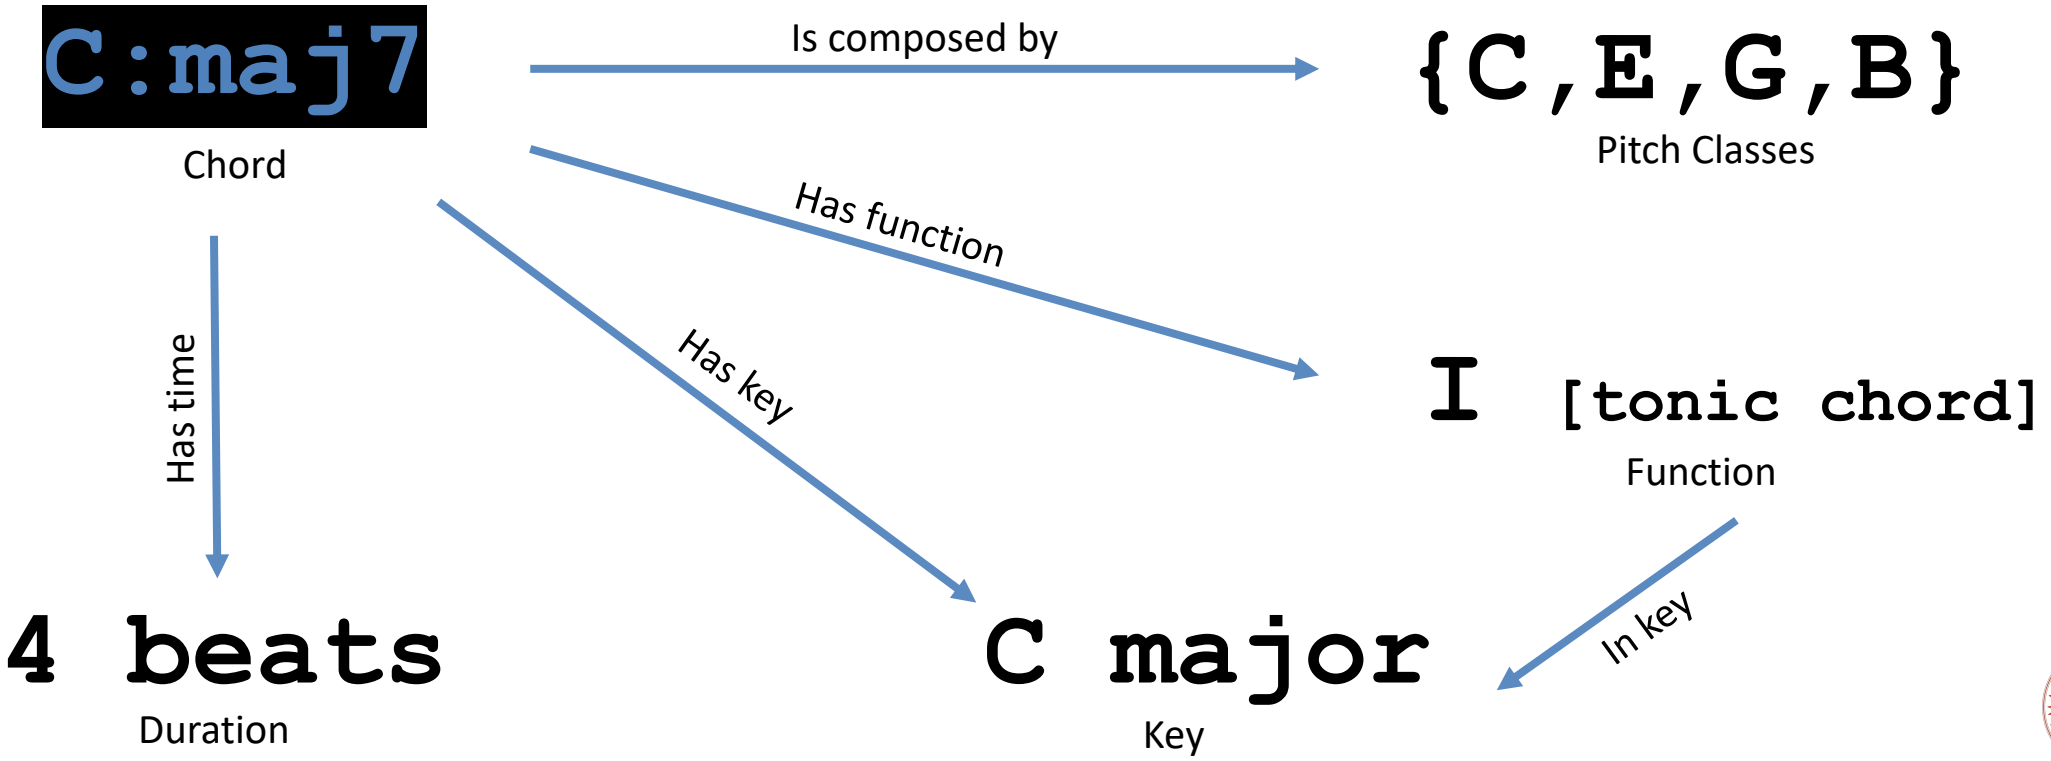
Composition consists in two things only.
The first is [...] what the Ancients called melody.
The second is [...] what we call **harmony** and **it alone merits the name of composition.**

*1780**

What is harmony?

In music, harmony is the process by which individual sounds are joined or composed into whole units or compositions.

Harmony is usually represented through chords.



Today's topics

Today we are going to expore some ideas on how to use **Semantic Web Technologies** can be used for:

1. **Representing musical data** (harmonic data, melodic data, annotations, metadata, etc.)
2. Describing music **similarity**
3. Enhancing **machine creativity**.

02

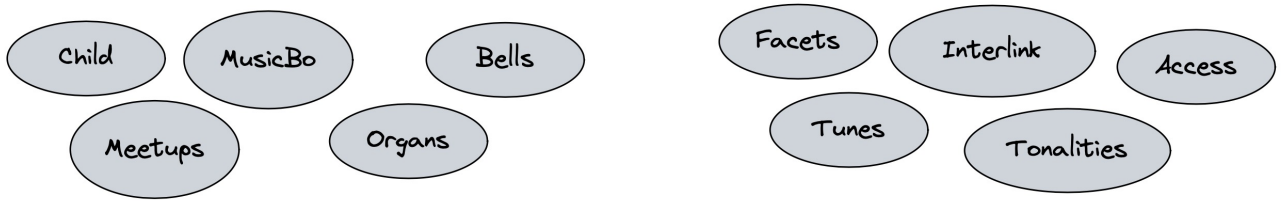
MUSIC ONTOLOGIES

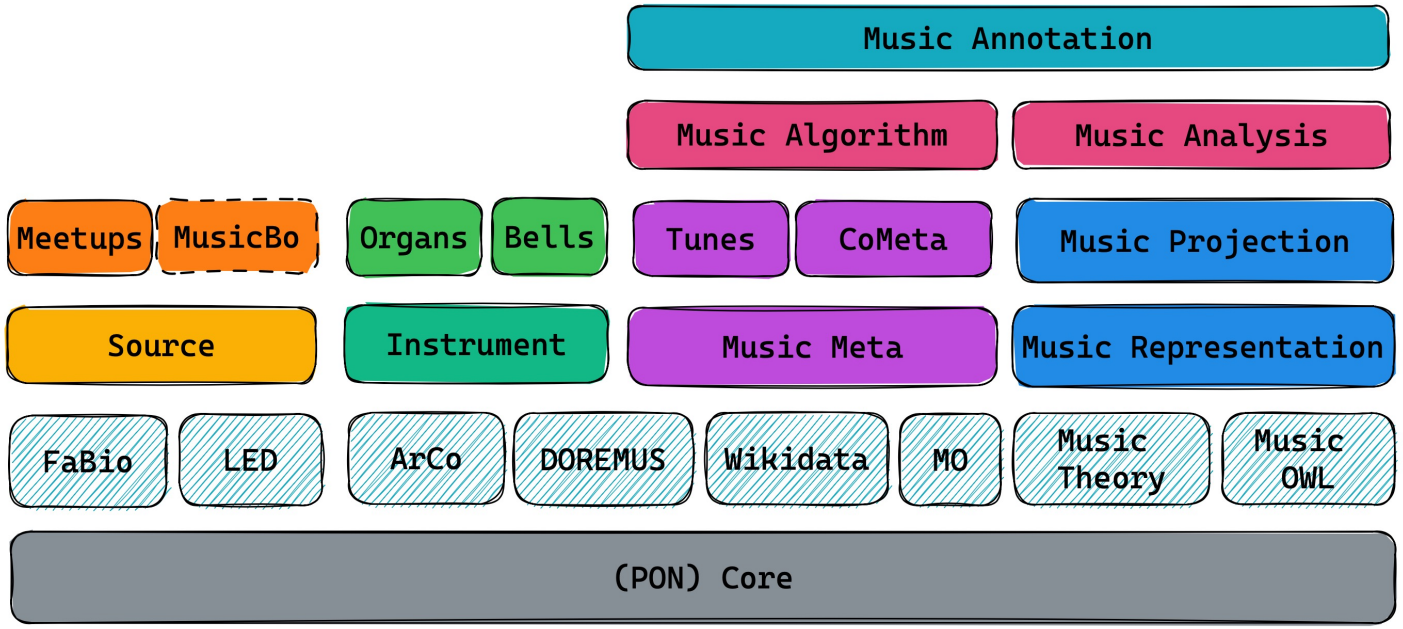
ALMA MATER STUDIORUM
UNIVERSITÀ DI BOLOGNA

Overview of exsisting Music Ontologies

The Polifonia Ontology Network (PON)

PON is a network of ontologies that can be used for describing heterogenous information in the **music domain**





https://github.com/polifonia-project/ontology-network

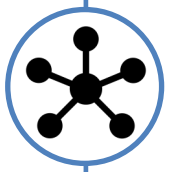
CASE STUDIES

Case Studies

I will be introducing two different (yet related) projects which show an **interaction between music and the Semantic Web**:



ChoCo: The Chord Corpus

Harmory: The Harmonic Memory

Terminology (in this presentation)

Chord annotation: the output of a human expert (or a computational method) identifying chords in a piece.
(synonyms here: a sequence of chords / a chord progression)

Chord observation / **occurrence**: the atomic elements of a chord annotation – the individual chords.

Tonality: given by the key (e.g. C) and the scale (e.g. “maj”).

ChoCo in a nutshell

FROM

18 datasets

14 formats

9 notations

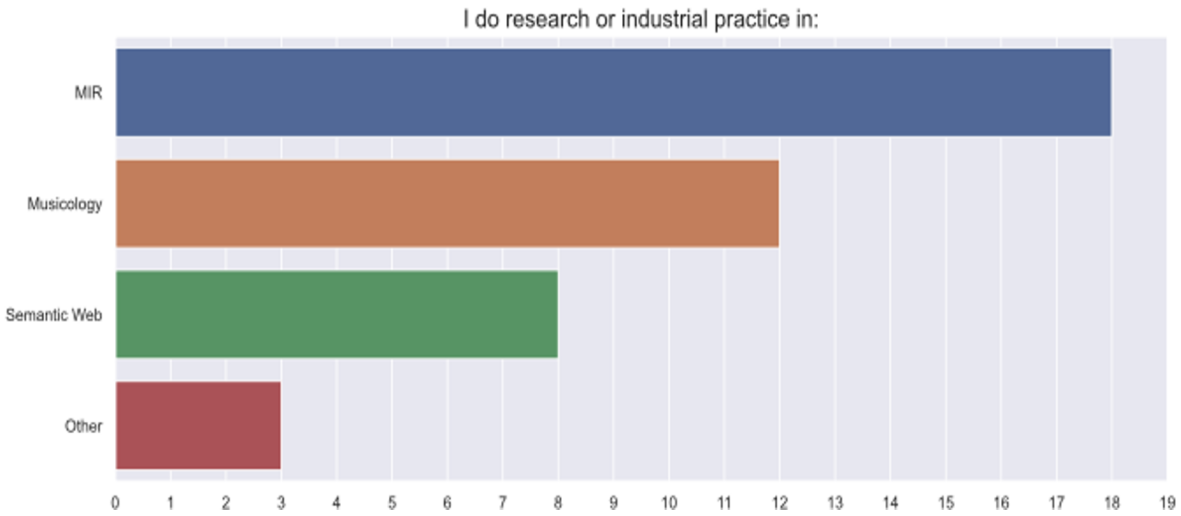
TO

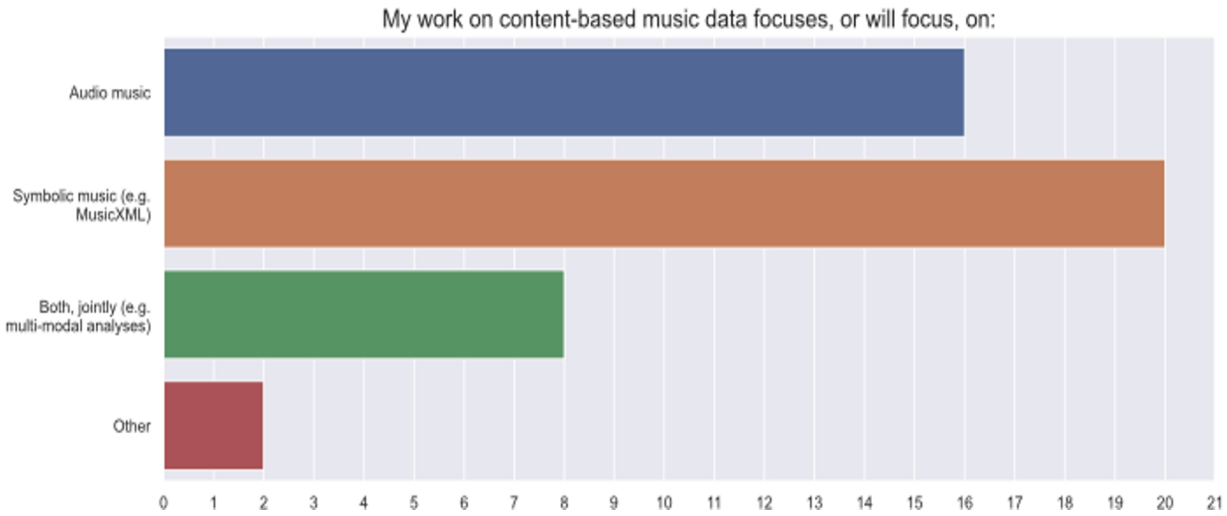
1 dataset

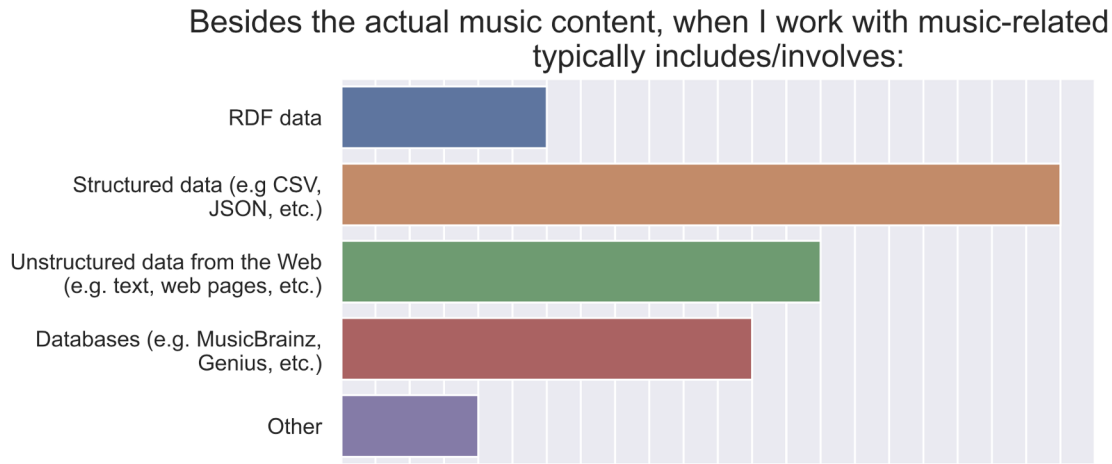
2 outputs

2 notations

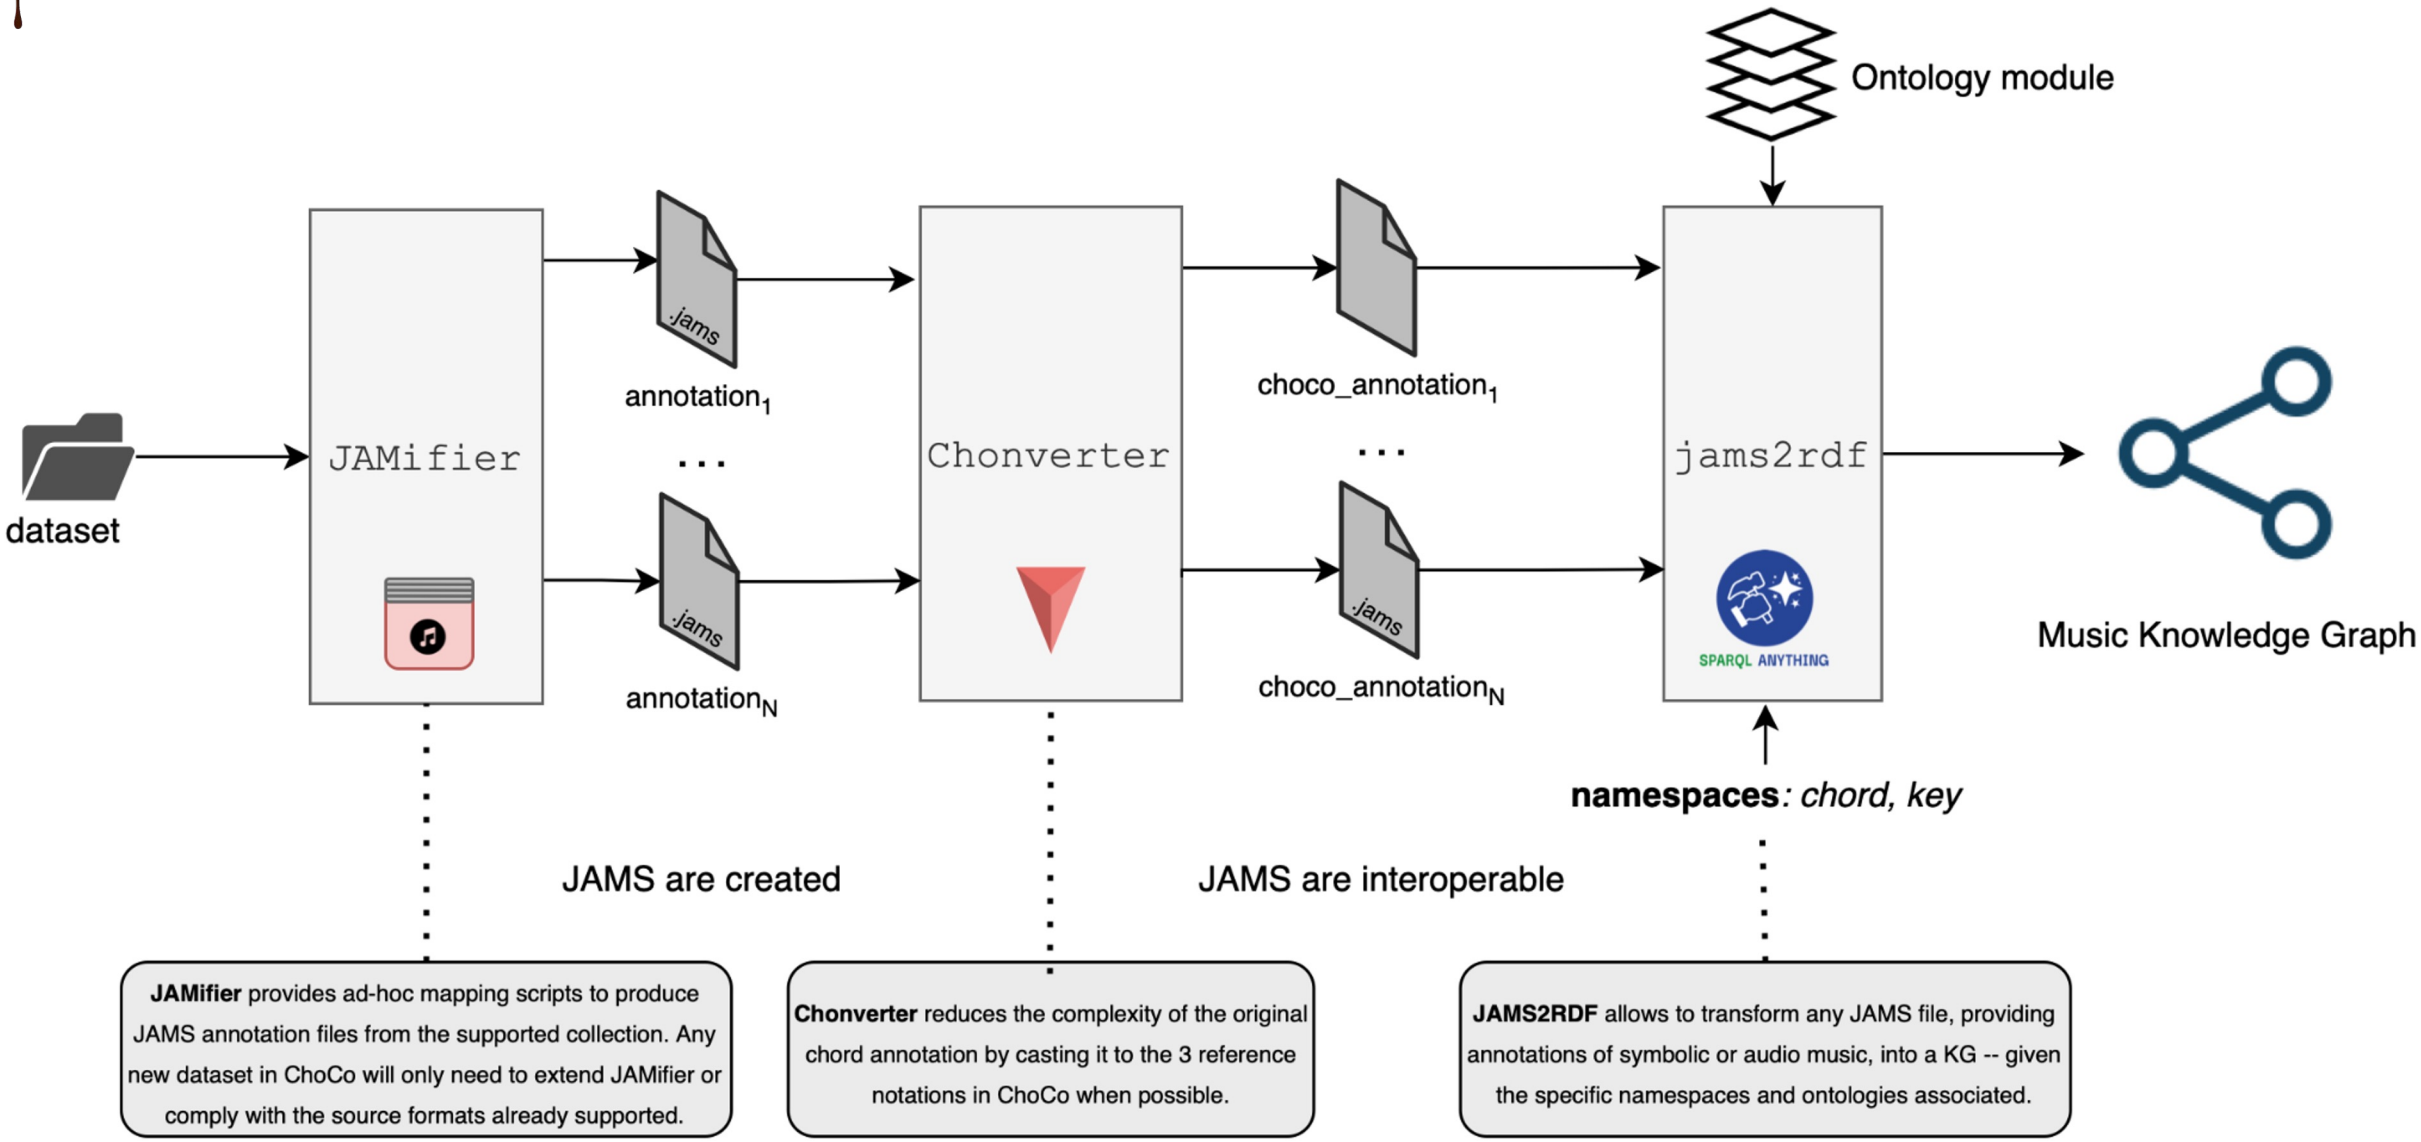
The need for ChoCo







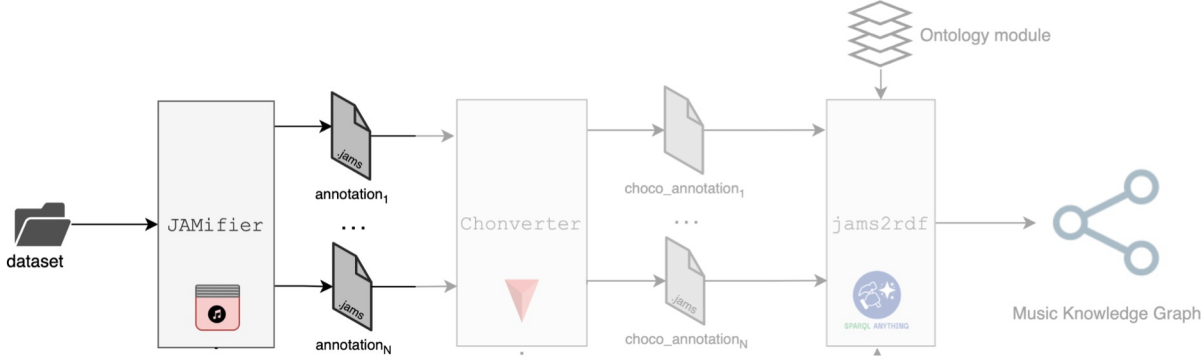
Data transformation workflow

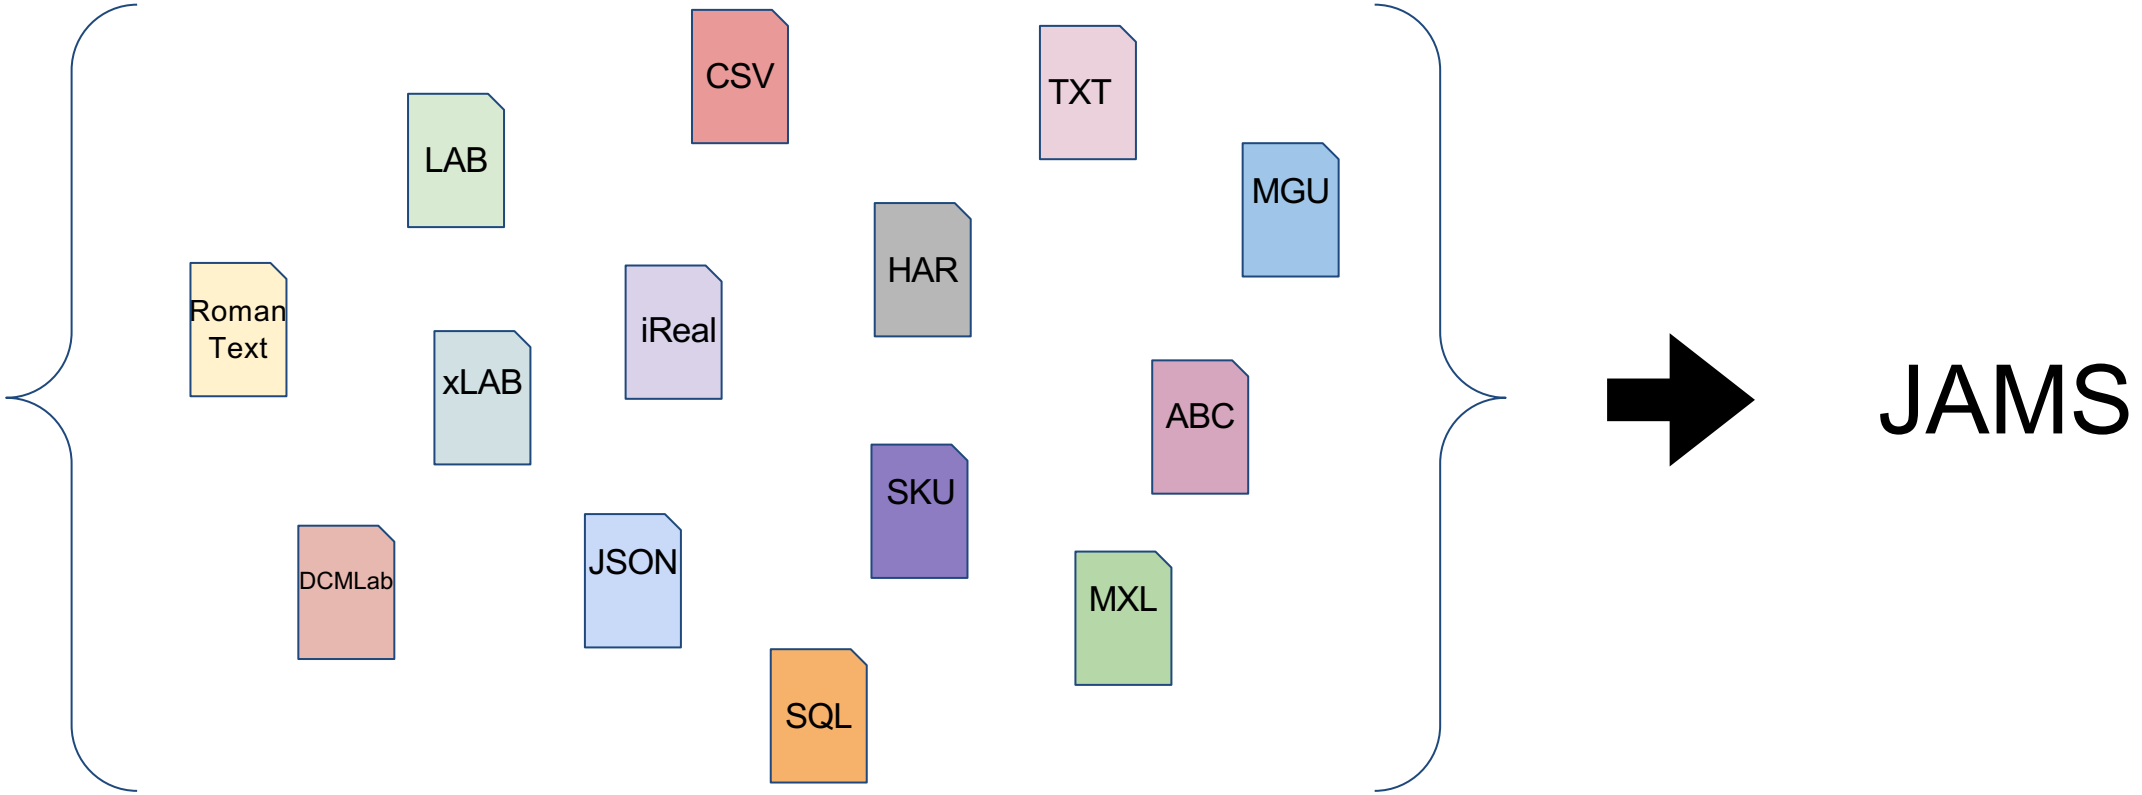


ChoCo

1. Jamifier

Challenge 1: little or no use of **annotation standards**

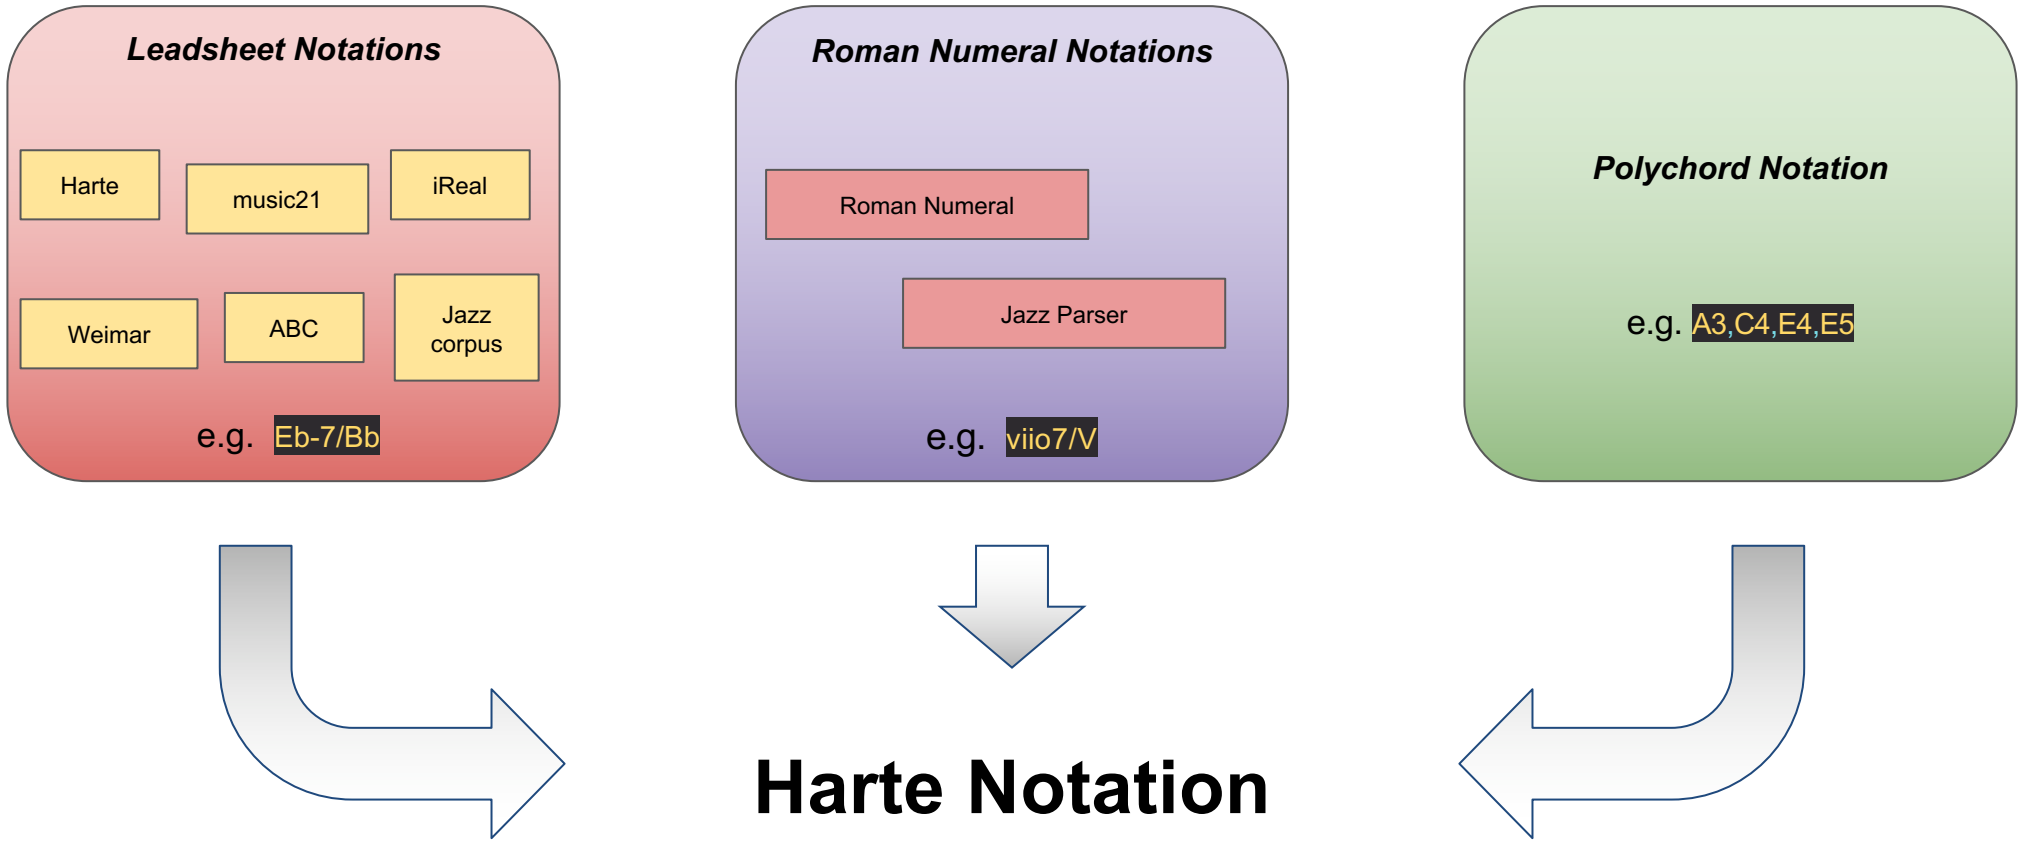




ChoCo

2. Chonverter

Challenge 2: too many **chord notations**



3. KG Generation

Challenge 3: making ChoCo data available and interoperable

Links to external resources

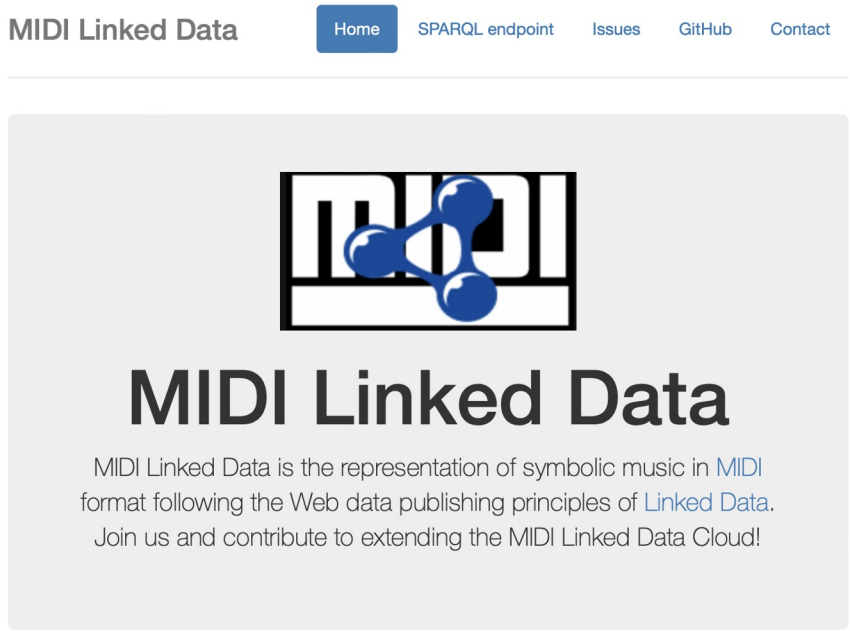
2.4K links to MIDI-LD, ~2K to LED

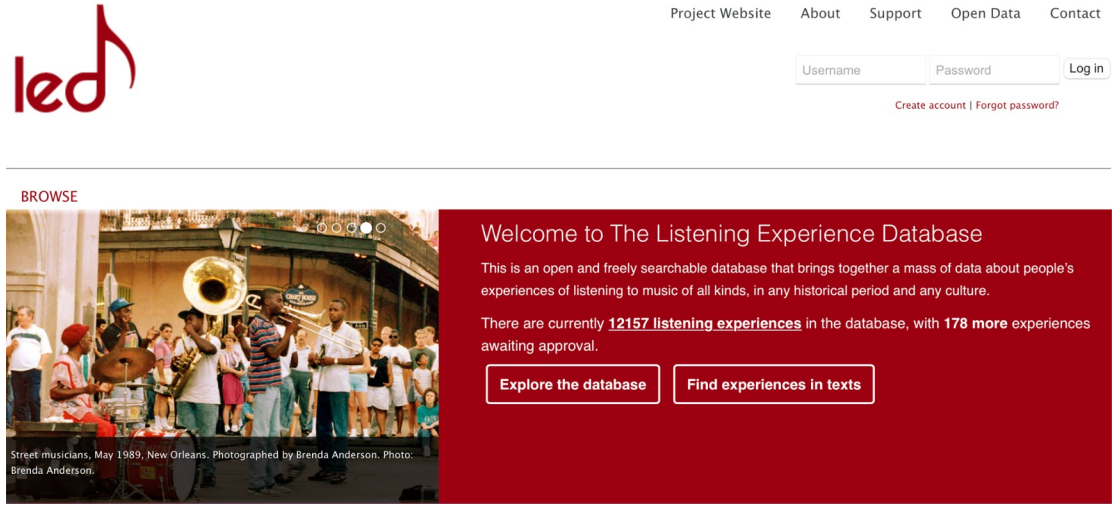
Additional links open up new research directions

Relating harmonic content (chord changes, harmonic complexity, tension, etc.) to other musical properties that are inherently present in the music (melodic contour, expressive variations, instrumental changes, etc.), or that may have been elicited certain emotions, memories, and feelings to listeners.

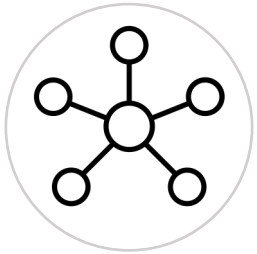
Example of listening experience of the "**So What**" (J. Coltrane) in LED (~/led/lexp/1431335026178)

> *«What do you mean by playing "without harmony"? Using a pedal tone, which Coltrane got into after a period of very dense harmonic playing. He would use one or two harmonic references throughout a song, as he did on "So What" [from Miles Davis's Kind of Blue, on Columbia]. It was basically D for sixteen bars, E flat for eight bars, and then back to D. Ultimately, he worked with only one harmonic reference point, and then in "Ascension" [from Best of John Coltrane: His Greatest Years, on Impulse] there was nothing harmonically.»*
>
> (Steve Kuhn in "The Great Jazz Pianists: Speaking of Their Lives and Music





Harmory in a nutshell



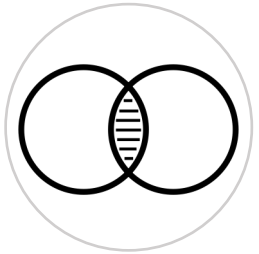
Harmory is a resource

Harmory is Knowledge Graph (KG)

Harmory contains harmonic data

Harmory contains:

1. Segmented harmonic patterns
2. Similarity information



Harmory can be used for AI creativity

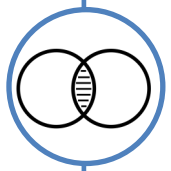
Harmory can be used a trustworthy framework for computational creativity

Harmory: the Harmonic Memory

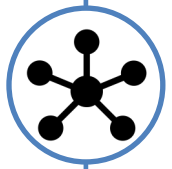
The creation of the Harmonic Memory can be summarised in four main steps

Encoding chords in the **Tonal Pitch Space**

Novelty-based **harmonic segmentation**



Linking harmonic segments via **similarity**



Knowledge Graph creation

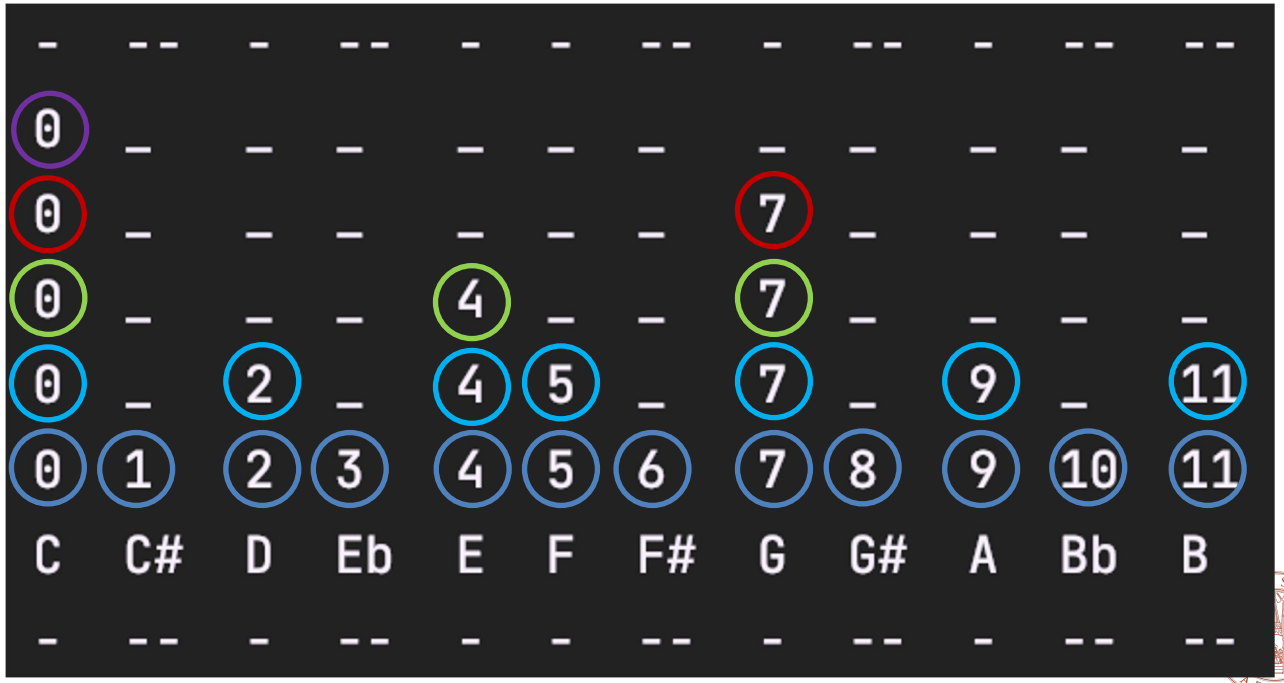
1. Encoding Chords in the Tonal Pitch Space (TPS)

The TPS provides a **scoring mechanism** that predicts the **proximity between two musical chords**.

It is based on the *Generative Theory of Tonal Music* and it is musicologically grounded.

It is composed by **five levels**:

1. Root level
2. Fifths level
3. Triadic level
4. Diatonic level
5. Chromatic level



Example of a C major chord levels of the TPS

1. Encoding Chords in the Tonal Pitch Space (TPS) (2)

The TPS distance between two chords (A and B) is calculated considering:

Difference between a C major and a E major chords according to the TPS

1. Number of **non-common pitch classes** divided by 2 in the levels (i-iv)

+

2. Minimum number of **Circle-of-Fifths rule** applications to shift between chord A and B

1. Encoding Chords in the Tonal Pitch Space (TPS) (3)

For a chord sequence, each chord is encoded as its distance to its local key.

For each comparison between two chords, the TPS returns a value in [0, 13].

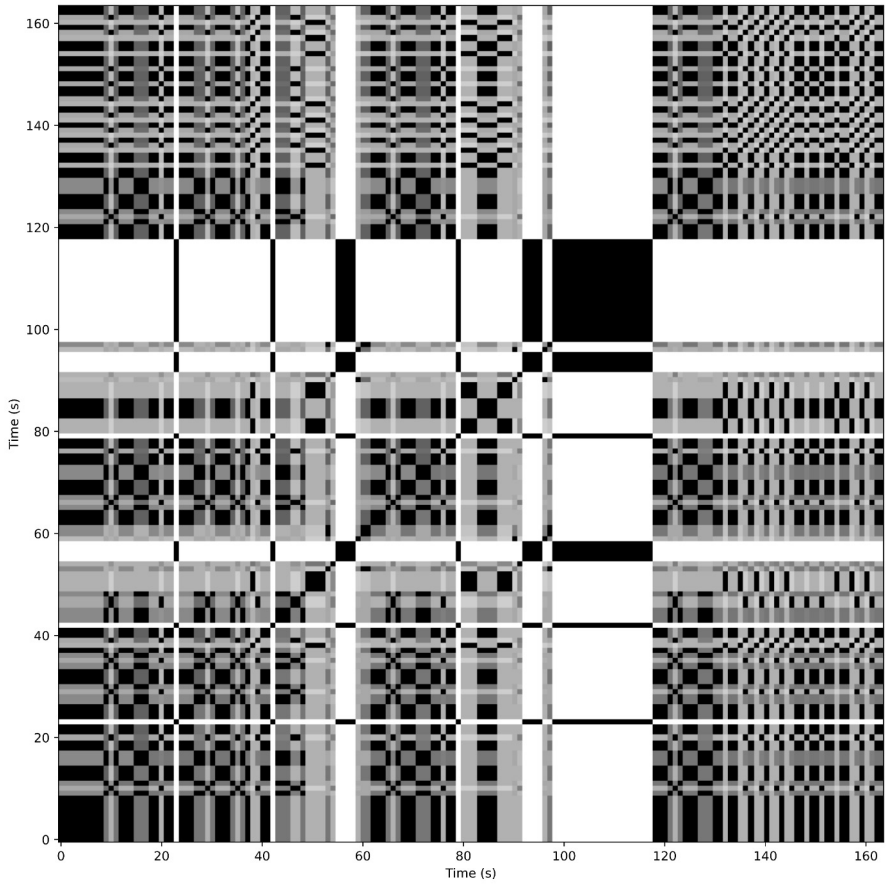
Chord sequence (*c*): [G, B:min, E:min7, . . .]
Tonal keys of c (*k*): [(G, major), (G, major), (G, major), . . .]
Onsets (*t*): [1, 3, 5, . . .]

TPS sequence: [2.0, 3.5, 0.0, 8.9, …]

2. Novelty-based Harmonic Segmentation

- A **Self Similarity Matrix (SSM)** is encoded starting from the TPS sequences

- Self-similarity matrices have been extensively used for **structure analysis on the audio signal**, due to their ability to reveal nested structural elements

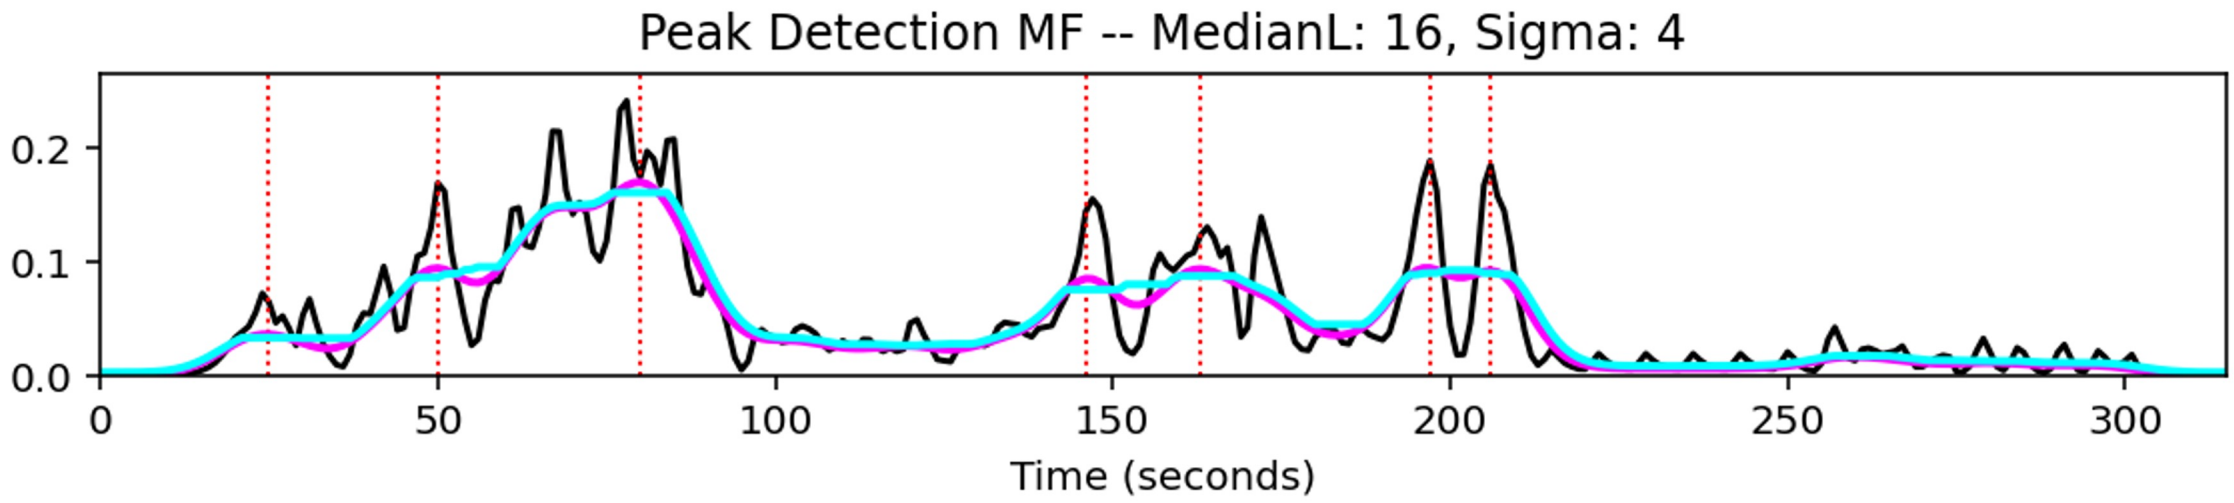


SSM of the track *"Crazy Little Thing called Love"*

2. Novelty-based Harmonic Segmentation (2)

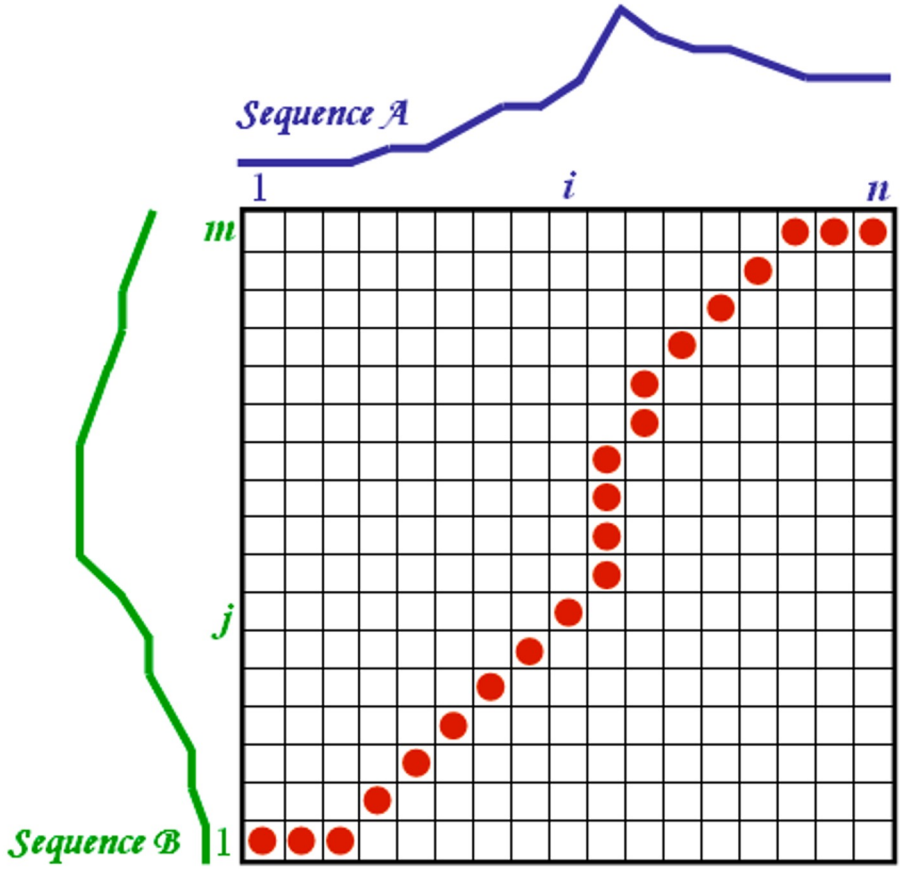
- To identify boundaries a **checkboard kernel (K)** is slided along the SSM main diagonal: this creates a **Novelty Curve:**
  - When K is located in a uniform region, **novelty** will be **low**
  - When K is at the crux of a checkerboard-like structure, **novelty** will be **high**

- Local maxima of the novelty curve are then used to **detect the boundaries** of neighbouring segments



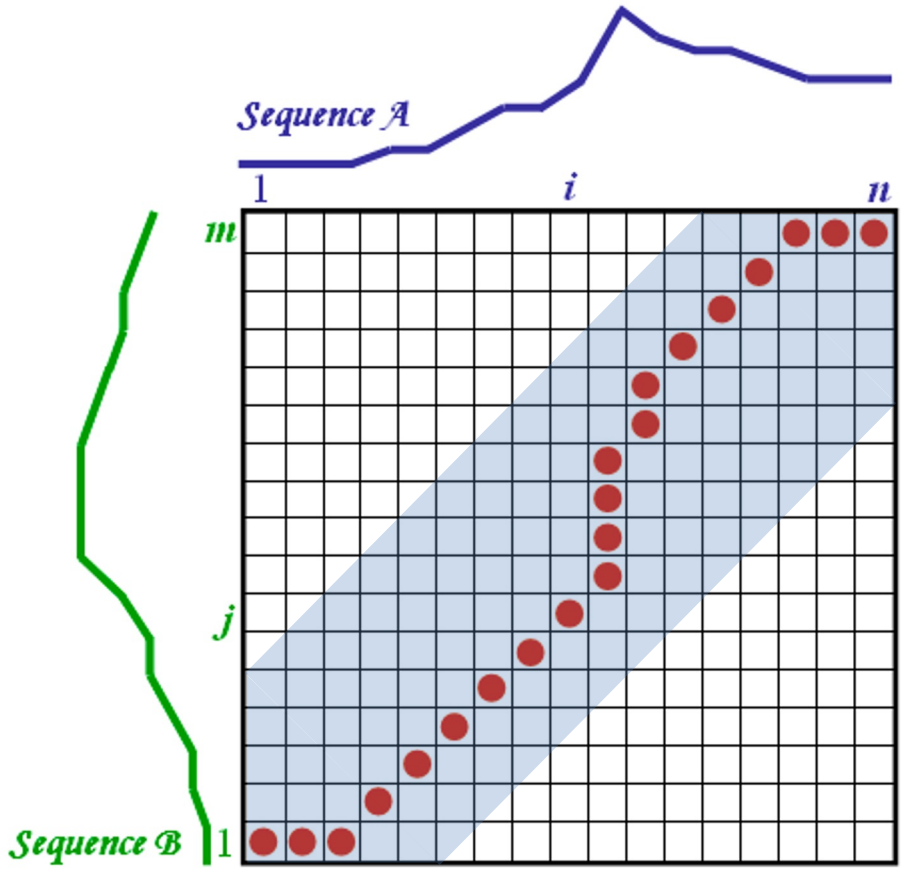
3. Linking Harmonic Segments via Similarity

- The TPS encoded sequences are compared using a **Dynamic Time Warping (DTW) algorithm**
- DTW is used for comparing and aligning time sequences (usually in the audio domain)
- DTW allows for non-linear alignment between the time series by considering the local warping path



3. Linking Harmonic Segments via Similarity (2)

- We used a variant of the vanilla DTW algorithm: **Sakoe-Chiba**
- Sakoe-Chiba allows to **constraint the search space** of the algorithm within a band ***(w)***
- This leads to a drop in computational time complexity:
  - Vanilla DTW: $O(N^2)$
  - Sakoe-Chiba DTW: $O(N * w)$



4. Knowledge Graph Creation

- An **ontology** for describing Harmory data has been created
- The ontology is part of the **Polifonia Ontology Network** (PON)
- Data has been transformed using **RDFLib**
- The generated Knowledge Graph contains **1429070 triples**

4. Knowledge Graph Creation (2)

Avenues for Computational Creativity: 1 – Pattern Discovery

The traversal of the Harmonic Memory makes it possible to obtain granular information of the harmonic structure of songs

Prompt 1: *For a given pattern, which are the tracks (titles, artists and genres) in which the pattern can be found?*

Prompt 2: *Which harmonic patterns are used in "Michelle" by The Beatles, but also in a classical composition?*

Prompt 3: *Which tracks include a dominant cycle in seven steps?*

Avenues for Computational Creativity: 2 – Chord Generation

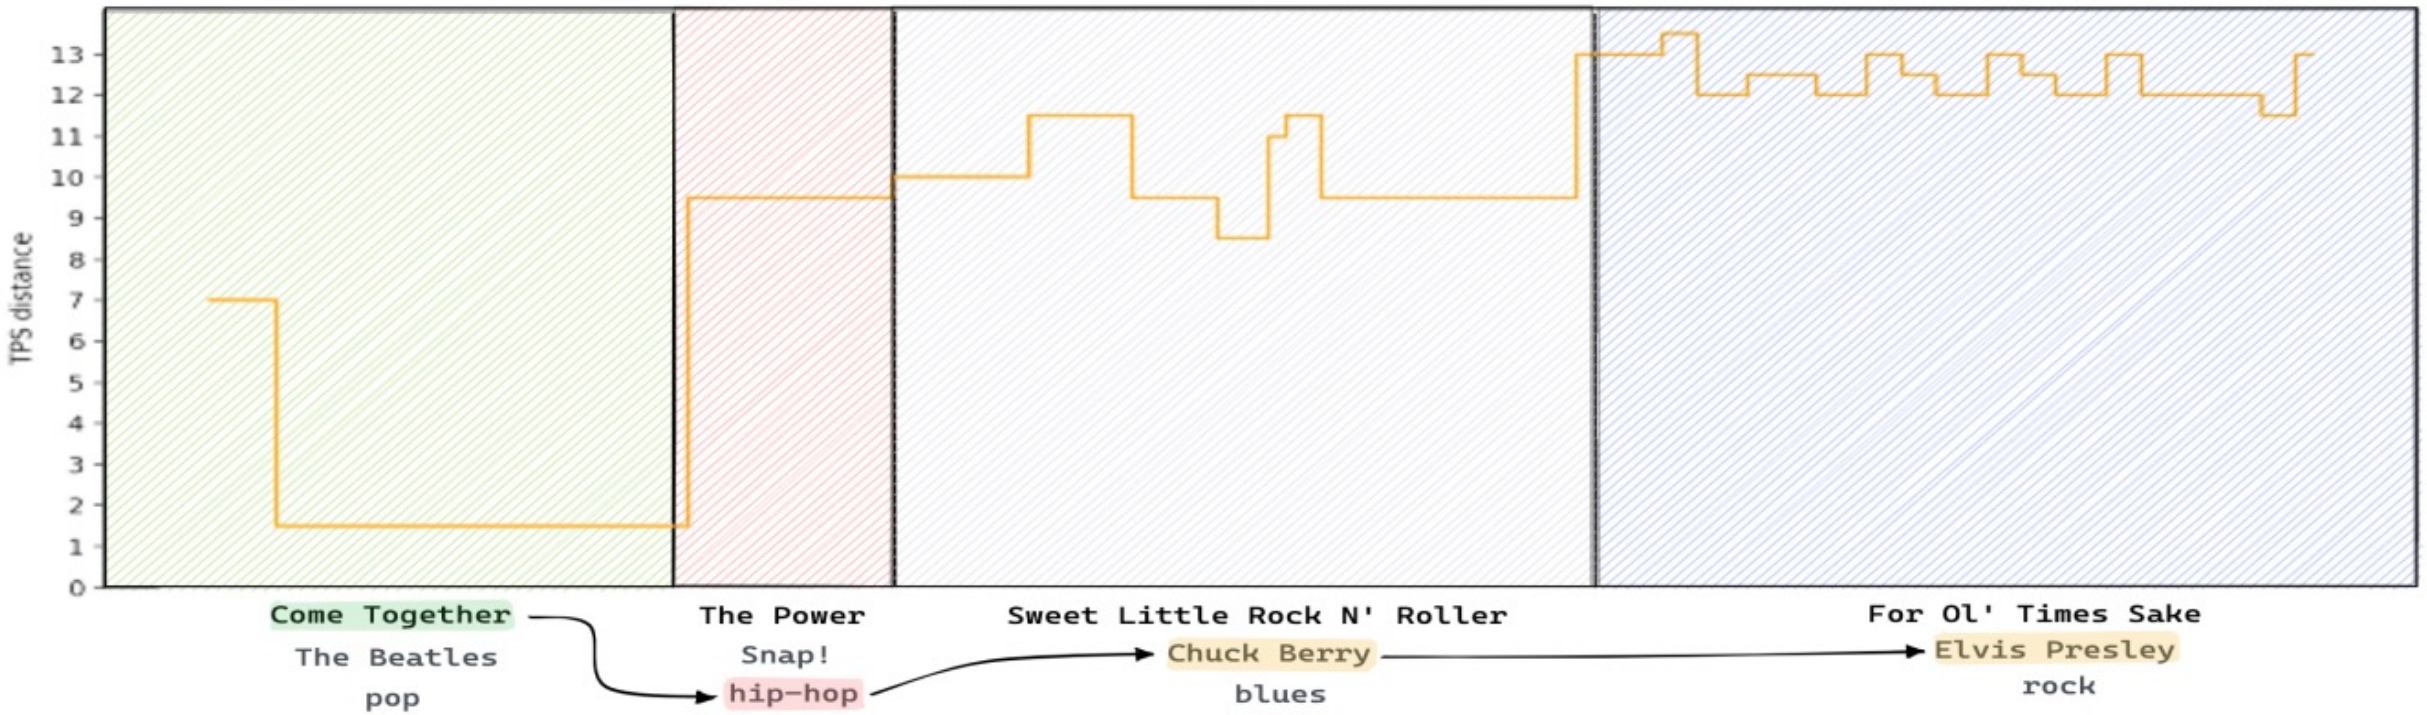
Harmory also enables combinational creativity use cases:

Prompt 4: *Given a chord sequence, which are its variations, and which tracks these variations belong to?*

Prompt 5: *Create a progression starting with "Come Together" by The Beatles, continuing with a segment found in a Rap song, and then continuing with another by Chuck Berry and Elvis Presley*

ALMA MATER STUDIORUM
UNIVERSITÀ DI BOLOGNA

Avenues for Computational Creativity: 2 – Chord Generation



Avenues for Computational Creativity: 3 – Harmonic Similarity

From a musicological perspective, the KG can also be used to analyse similarity relations between tracks:

Prompt 6: *Given a track, which tracks contain patterns with a distance of less than 0.2?*

04

EXERCISE(s)

ALMA MATER STUDIORUM
UNIVERSITÀ DI BOLOGNA

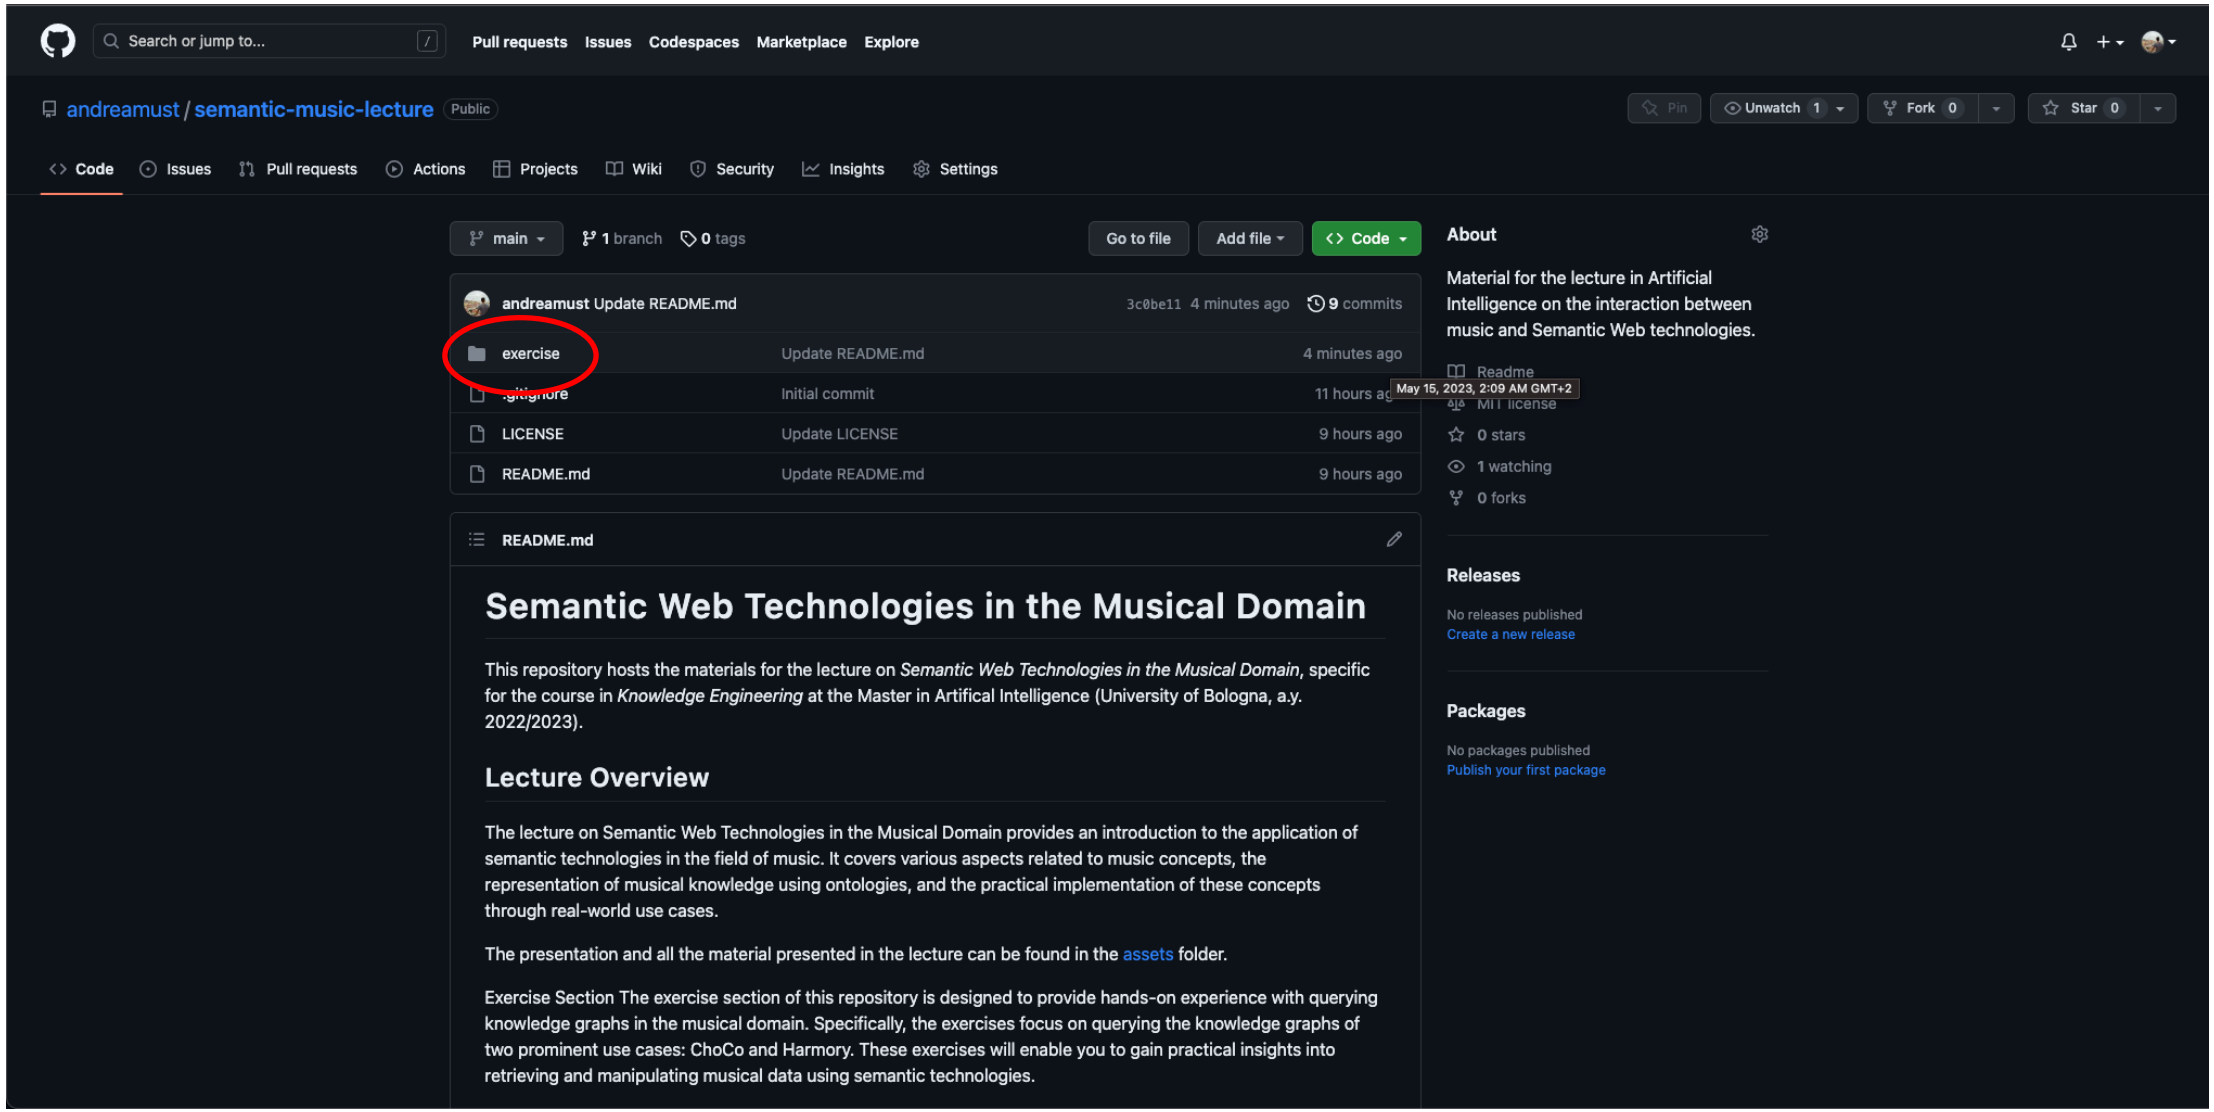
Task Description

- The exercise consists in **querying Knowledge Graphs you are not familiar with**
- The two knowledge graphs have been introduced during this lecture, namely:
  - *ChoCo*
  - *Harmory*
- You will be provided with a **sample query** and a few **competency questions**
- Working in pairs, you are asked to create SPARQL queries from:
  - One (or more) competency questions
  - New competency questions you will define (be creative!)

Exercise Link

https://github.com/andreamust/semantic-music-lecture

Exercise Link



Exercise Overview

1. Divide the class in **pairs**
2. **Pick one project** (*Harmory* or *ChoCo*)
3. **Fork** the repository
4. **Get familiar** with the Knowledge Graph and the Ontology
5. Write a SPARQL Query for one of the **predefined Competency Questions**
6. **Create you own** Competency Question
7. **Submit** you queries opening a **pull-request**

Querying ChoCo

```
SELECT DISTINCT ?observationValue ?startTime ?startTimeType ?duration ?durationType
WHERE {
  ?recording a mp:Recording ;
    mc:hasTitle "Michelle" ;
    jams:hasJAMSAnnotation ?annotation .
  ?annotation jams:includesObservation ?observation ;
    jams:hasAnnotationType "chord" .
  ?observation rdfs:label ?observationValue ;
    jams:hasMusicTimeInterval [jams:hasMusicTimeDuration [ jams:hasValue ?duration ; jams:hasValueType ?durationType ] ;
      jams:hasMusicTimeStartIndex [ jams:hasMusicTimeIndexComponent [ jams:hasValue ?startTime ; jams:hasValueType ?startTimeType  ]]] .
}
ORDER BY (?startTime)
LIMIT 10
